## Improving the prospects for Heat Recovery from Data Centers

1. -What is role of innovation, pricing and regulation for heat recovery from data centers?
  - ✓ There must be an economic benefit for the data centers to make heat recovery
  - ✓ RackCDU easily recover 65+% of the heat from the Datacenter, we just need to find a way to use the heat
  - ✓ We need to make regulation for reuse of heat.
2. -What can be done to mitigate the factors preventing heat recovery from data centers?
  - ✓ Eliminate or low taxes so it is profitable
  - ✓ Make it profitable to sell the heat back to district heating
3. -How can heating systems and markets be adapted and developed to increase the value of heat recovery from data centers?
  - ✓ IT and building departments must work together
  - ✓ Make district heating system in the cities so that they can benefit from the recovered heat
  - ✓ Makes it possible to sell the recovered heat

# Building heat

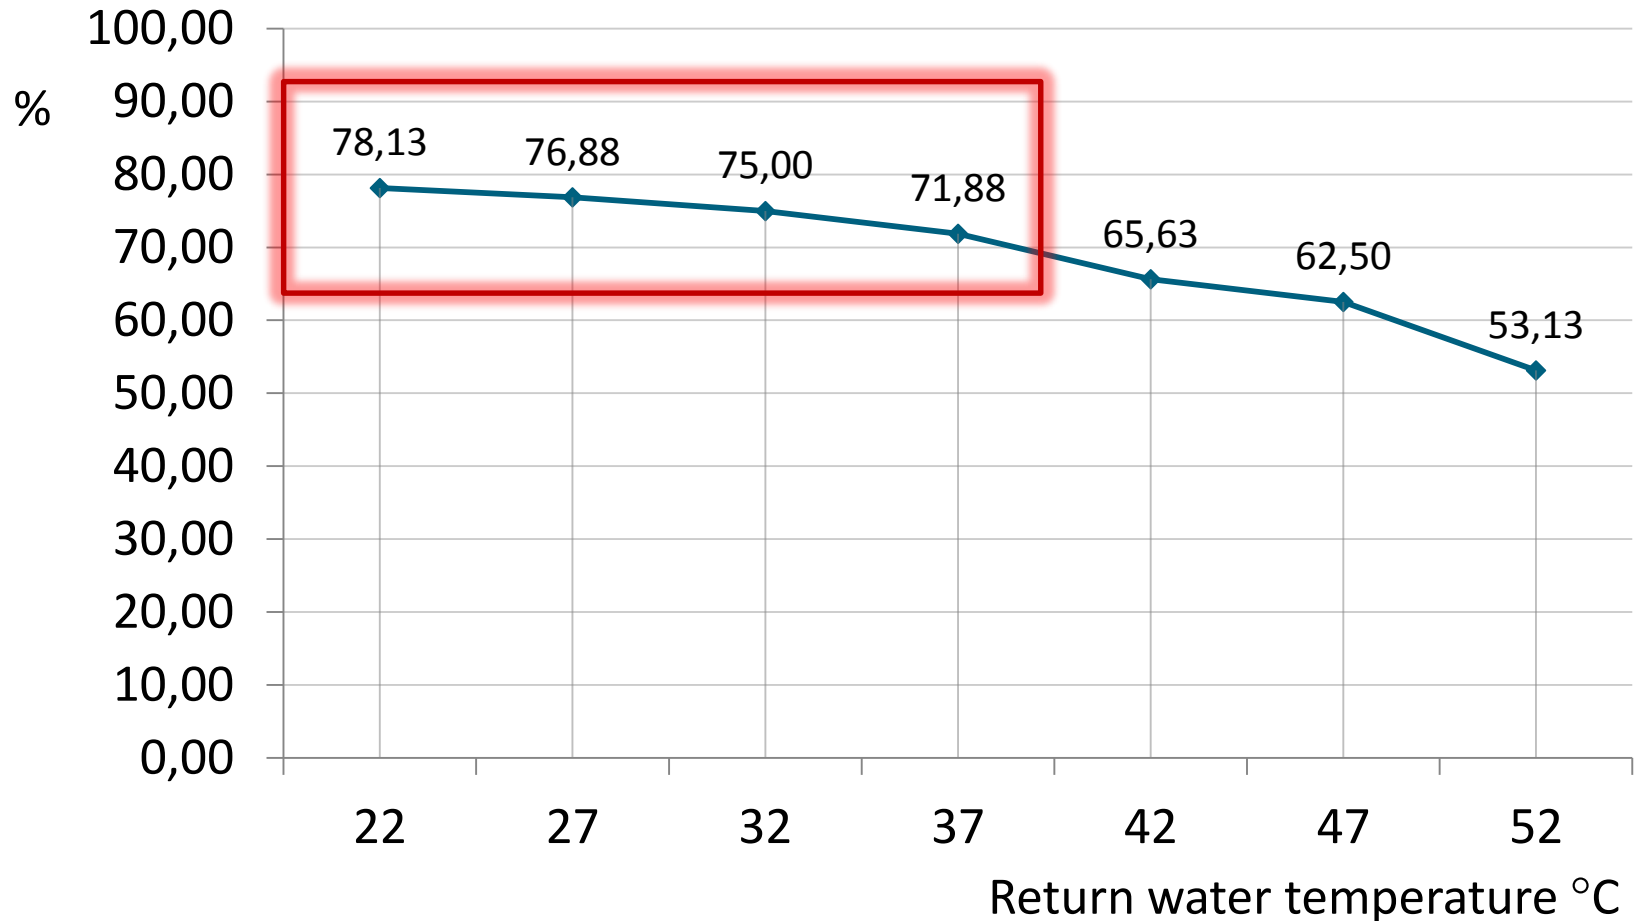

- Outside temp  $< 12^{\circ}\text{C}$  -> need building heat

# RackCDU Heat Capture

## Initial Test Results\*

\* Benchmark (HPL) run on 1 rack of 48 HP SL230 g8 servers with dual 10 core 2.8 GHz Ivy Bridge, upgraded with Asetek RackCDU water-cooling. Rack load was ~16 kW. Supply temp at 12°C and Room temp at 20°C

# System and LCP Power

## Air Cooled versus Liquid Cooled Power Consumption

■ SysPowAC ■ LCPowAC ■ SysPowLC ■ LCPowLC
